

# **PROJECT PROPOSAL**

## **PixelPlusUltra**

**Created by:**

Joshi Jay Vijaybhai  
(200485155)

## **Problem Statement**

When scaling up low-resolution photographs, the present state of image resolution improvement technology is restricted, frequently producing poor and blurry images. This restriction lowers the quality of photographs in a variety of fields, including surveillance, entertainment, and medical imaging. The "PixelPlusUltra" project, which intends to use the power of SRGAN (Super-Resolution Generative Adversarial Network) to greatly enhance the resolution of photographs, in order to provide crisper, more detailed, and aesthetically pleasing outcomes, is our answer to this problem. Additionally, to illustrate the difference in how to solve this issue, we may also use ESRGAN (Enhanced Super-Resolution Generative Adversarial Network).

## **Project Goals and Estimated Achievements**

- Create a sophisticated SRGAN-based picture super-resolution model.
- Estimated Achievement: Develop a model that can consistently improve picture resolution while delivering excellent outcomes for a range of image types.
- Achieve a significant improvement in image resolution.
- Estimated Achievement: Increasing picture resolution while preserving visual integrity and image quality is what's expected to be accomplished.
- Address probable artefacts and difficulties with super-resolution of images.

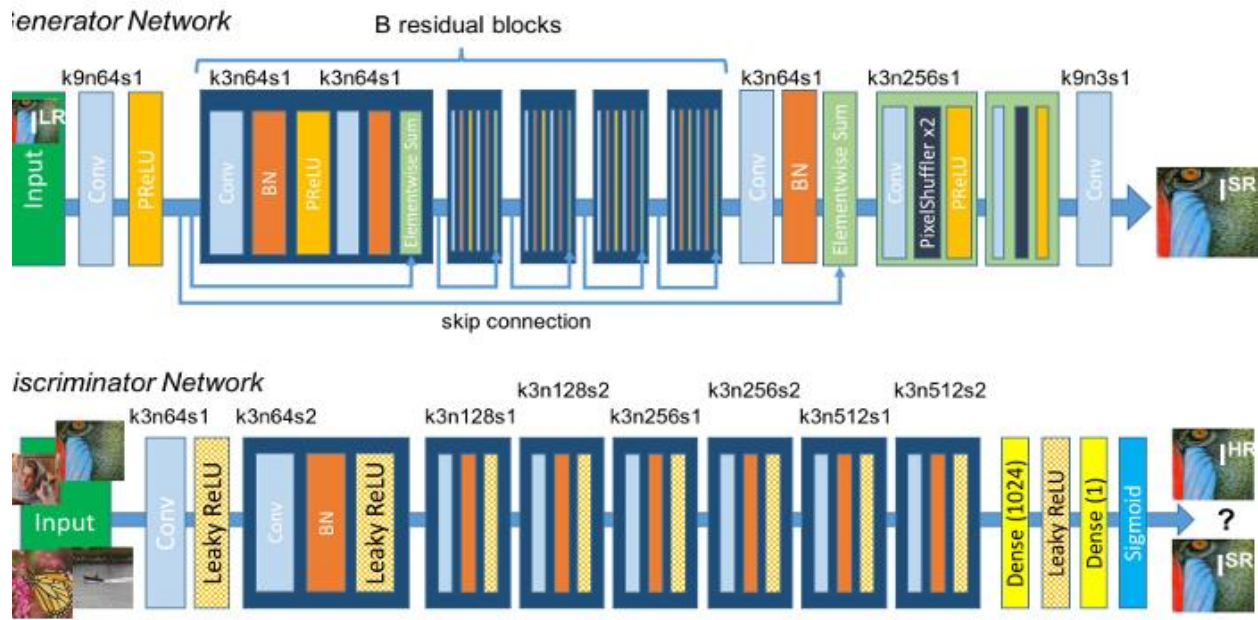

- Estimated Achievement: Ensure a reliable and efficient picture improvement process by implementing solutions to typical problems including noise, artefacts, and computing efficiency.
- Improve the model's performance in a variety of usage situations.
- Estimated Achievement: Carry out extensive optimization to make sure the model works effectively in industries including surveillance, photography, and medical imaging.
- Create a sophisticated ESRGAN-based picture super-resolution model.
- Estimated Achievement: Perform the aforementioned techniques on the ESRGAN model as well in order to improve the photos using it.
- Compare the output from the two models.

## **Approach**

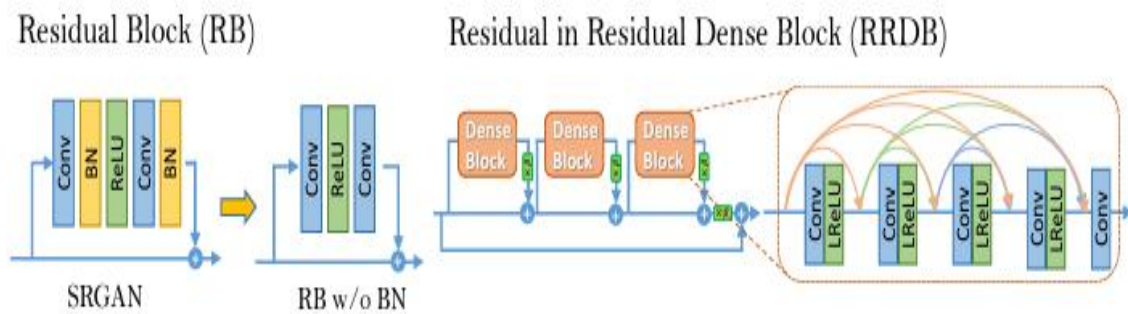

I broke this project down into six sections, which are shown below:

1. Data gathering: To train and test the SRGAN model, compile a broad datasets of low- and high-resolution pictures.
2. Model Development: Using the gathered dataset, create an SRGAN model and refine it. Utilize methods to guarantee image quality and reduce artefact.
3. Optimization: Put optimizations into practise to make sure the model is effective in terms of calculation and processing time.
4. Feedback Loop: Collect comments to enhance the model.
5. ESRGAN turn: Apply the same procedures to the ESRGAN model.
6. Comparing the output from the ESRGAN and SRGAN models.

### **Git Repo for ESRGAN (Chapter 11):**

<https://github.com/paperd/deep-learning-models/blob/main/chapter11/ch11.ipynb>

## **The Things that I'll be utilising**

- Deep learning frameworks: For the creation and training of models, use deep learning libraries like TensorFlow or PyTorch.
- SRGAN Architecture:  
Implement the SRGAN architecture as the building block for super-resolution of images.
- ESRGAN Architecture:  
Implement the ESRGAN architecture as the main building block for picture super-resolution.
- High-Quality Datasets:  
Highquality datasets should be obtained for training and validation. They should be diversified and of high quality.
- Hardware Resources: To speed up the model's inference and training, use potent GPUs or TPUs.
